HTML Images Syntax

In HTML, images are defined with the **** tag.

The tag is empty, it contains attributes only, and does not have a closing tag.

The src attribute specifies the URL (web address) of the image:

```

```

The alt Attribute

The alt attribute provides an alternate text for an image, if the user for some reason cannot view it (because of slow connection, an error in the src attribute, or if the user uses a screen reader).

If a browser cannot find an image, it will display the value of the alt attribute:

Example

```

```

[Try it Yourself »](#)

The alt attribute is required. A web page will not validate correctly without it.

HTML Forms

[HTML Forms](#)

Image Size - Width and Height

You can use the **style** attribute to specify the width and height of an image.

The values are specified in pixels (use px after the value):

Example

```

```

[Try it Yourself »](#)

Alternatively, you can use the **width** and **height** attributes. Here, the values are specified in pixels by default:

Example

```

```

[Try it Yourself »](#)

Note: Always specify the width and height of an image. If width and height are not specified, the page will flicker while the image loads.

HTML5 Tutorial

[HTML HOME](#)[HTML Introduction](#)[HTML Editors](#)[HTML Basic](#)[HTML Elements](#)[HTML Attributes](#)[HTML Headings](#)[HTML Paragraphs](#)[HTML Styles](#)[HTML Formatting](#)[HTML Quotations](#)[HTML Comments](#)[HTML Colors](#)[HTML CSS](#)[HTML Links](#)[HTML Images](#)[HTML Tables](#)[HTML Lists](#)[HTML Blocks](#)[HTML Classes](#)[HTML Iframes](#)[HTML JavaScript](#)[HTML File Paths](#)[HTML Head](#)[HTML Layout](#)[HTML Responsive](#)[HTML Computercode](#)[HTML Entities](#)[HTML Symbols](#)[HTML Charset](#)[HTML URL Encode](#)[HTML XHTML](#)

HTML Forms

[HTML Forms](#)

Both the width, height, and style attributes are valid in HTML5.

However, we suggest using the style attribute. It prevents internal or external styles sheets from changing the original size of images:

Example

```
<!DOCTYPE html>
<html>
<head>
<style>
img {
    width:100%;
}
</style>
</head>
<body>

</body>
</html>
```

[Try it Yourself »](#)

Images in Another Folder

If not specified, the browser expects to find the image in the same folder as the web page.

However, it is common to store images in a sub-folder. You must then include the folder name in the src attribute:

Example

```

```

Images on Another Server

Some web sites store their images on image servers.

Actually, you can access images from any web address in the world:

Example

```

```

[Try it Yourself »](#)

You can read more about file paths in the chapter [HTML File Paths](#).

Animated Images

The GIF standard allows animated images:

Example

```

```

[Try it Yourself »](#)

Note that the syntax of inserting animated images is no different from non-animated images.

Using an Image as a Link

To use an image as a link, simply nest the tag inside the <a> tag:

HTML5 Tutorial

[HTML HOME](#)[HTML Introduction](#)[HTML Editors](#)[HTML Basic](#)[HTML Elements](#)[HTML Attributes](#)[HTML Headings](#)[HTML Paragraphs](#)[HTML Styles](#)[HTML Formatting](#)[HTML Quotations](#)[HTML Comments](#)[HTML Colors](#)[HTML CSS](#)[HTML Links](#)[HTML Images](#)[HTML Tables](#)[HTML Lists](#)[HTML Blocks](#)[HTML Classes](#)[HTML Iframes](#)[HTML JavaScript](#)[HTML File Paths](#)[HTML Head](#)[HTML Layout](#)[HTML Responsive](#)[HTML Computercode](#)[HTML Entities](#)[HTML Symbols](#)[HTML Charset](#)[HTML URL Encode](#)[HTML XHTML](#)

HTML Forms

[HTML Forms](#)

```
<a href="default.asp">
  
</a>
```

[Try it Yourself »](#)

Note: border:0; is added to prevent IE9 (and earlier) from displaying a border around the image (when the image is a link).

Image Floating

Use the CSS **float** property to let the image float to the right or to the left of a text:

Example

```
<p>
The image will float to the right of the text.</p>
```

```
<p>
The image will float to the left of the text.</p>
```

[Try it Yourself »](#)

Image Maps

Use the <map> tag to define an image-map. An image-map is an image with clickable areas.

The name attribute of the <map> tag is associated with the 's usemap attribute and creates a relationship between the image and the map.

The <map> tag contains a number of <area> tags, that defines the clickable areas in the image-map:

Example

HTML Forms

[HTML Forms](#)

```

<map name="planetmap">
  <area shape="rect" coords="0,0,82,126" alt="Sun" href="sun.htm">
  <area shape="circle" coords="90,58,3" alt="Mercury" href="mercur.htm">
  <area shape="circle" coords="124,58,8" alt="Venus" href="venus.htm">
</map>
```

[Try it Yourself »](#)

Background Image

To add a background image on an HTML element, use the CSS property `background-image` :

Example

To add a background image on a web page, specify the background-image property on the BODY element:

```
<body style="background-image:url('skies.jpg')">

<h2>Background Image</h2>

</body>
```

[Try it Yourself »](#)

Example

To add a background image on a paragraph, specify the background-image property on the P element:

```
<body>

<p style="background-image:url('skies.jpg')">
...
</p>
```

The <picture> Element

HTML5 introduced the <picture> element to add more flexibility when specifying image resources.

The <picture> element contains a number of <source> elements, each referring to different image sources. This way the browser can choose the image that best fit the current view and/or device.

Each <source> element have attributes describing when their image is the most suitable.

The browser will use the first <source> element with matching attribute values, and ignore any following <source> elements.

Example

Show one picture if the browser window (viewport) is a minimum of 650 pixels, and another image if not, but larger than 465 pixels.

```
<picture>
<source media="(min-width: 650px)" srcset="img_pink_flowers.jpg">
<source media="(min-width: 465px)" srcset="img_white_flower.jpg">

</picture>
```

[Try it Yourself »](#)

Note: Always specify an element as the last child element of the <picture> element. The element is used by browsers that do not support the <picture> element, or if none of the <source> tags matched.

Chapter Summary

- Use the HTML **** element to define an image
- Use the HTML **src** attribute to define the URL of the image
- Use the HTML **alt** attribute to define an alternate text for an image, if it cannot be displayed
- Use the HTML **width** and **height** attributes to define the size of the image
- Use the CSS **width** and **height** properties to define the size of the image (alternatively)
- Use the CSS **float** property to let the image float
- Use the HTML **<map>** element to define an image-map
- Use the HTML **<area>** element to define the clickable areas in the image-map
- Use the HTML ****'s element **usemap** attribute to point to an image-map
- Use the HTML **<picture>** element to show different images for different devices

Note: Loading images takes time. Large images can slow down your page. Use images carefully.
